

Getting to know JSON, part 1

Developer tools

All modern browsers have developer tools that include a JavaScript console, and a way to inspect web storage. Here's how you access the developer tools in each major browser.

Safari: Turn on the Develop menu using **Safari>Preferences>Advanced**. Check the box next to Show Develop in menu bar. Once you exit Preferences, you'll see a new Develop menu appear. Choose **Develop>Show Web Inspector** to bring up the developer console. To see Local Storage, select **Resources>Local Storage**.

Firefox: Use **Tools>Web Developer>Web Console** to bring up the developer console. To see Local Storage, type `localStorage` at the console prompt and then click on the object to see the details.

Chrome: Ctrl/right-click on any element or the background of a webpage, and choose **Inspect Element** to bring up the developer console. To see Local Storage, choose **Resources>Local Storage**.

Opera: Ctrl/right-click on any element or the background of a webpage, and choose **Inspect Element**. To see Local Storage, choose **Storage>Local Storage**.

IE: To use developer tools in IE9, first download and install the Developer Tool Bar. (Note: these tools are not compatible with IE8, so either upgrade to IE9 (the current version of IE) or you'll need to download a different toolset). To use the Developer Tool Bar once it's installed, press F12, or use **Tools>Developer Tools**.

Note: browser developer tools are changing fast, so these instructions might be out of date quickly!
